

When Not to use mod_perl

Ben Evans (kitty@cpan.org)
Hadros Ltd

Overview / Disclaimer

- I can't talk about everything

Overview / Disclaimer

- I can't talk about everything
- I'll just do the case of porting a CGI application to mod_perl

mod_perl and its relationship to Apache

- Don't migrate to mod_perl if there's a chance you won't be using Apache in the foreseeable future
- There are a "couple" of things about Apache that need to be taken into account when using mod_perl

mod_perl and its relationship to Apache

- Don't migrate to mod_perl if there's a chance you won't be using Apache in the foreseeable future
- There are a "couple" of things about Apache that need to be taken into account when using mod_perl
 - ◆ Both Apache and Perl are large, complex pieces of software

mod_perl and its relationship to Apache

- Don't migrate to mod_perl if there's a chance you won't be using Apache in the foreseeable future
- There are a "couple" of things about Apache that need to be taken into account when using mod_perl
 - ◆ Both Apache and Perl are large, complex pieces of software
 - ◆ A certain amount of evilness is to be expected from the integration of them

When You're Not Getting Many Hits

- So how many?

When You're Not Getting Many Hits

- So how many?
- A short answer is, *It Depends*

When You're Not Getting Many Hits

- So how many?
- A short answer is, *It Depends*
- A recent thread on London.pm had some basic numbers, those and experience give:

When You're Not Getting Many Hits

- So how many?
- A short answer is, *It Depends*
- A recent thread on London.pm had some basic numbers, those and experience give:
- About 40-50 hits per sec and you probably should think about transitioning

When You're Not Getting Many Hits

- So how many?
- A short answer is, *It Depends*
- A recent thread on London.pm had some basic numbers, those and experience give:
- About 40-50 hits per sec and you probably should think about transitioning
- About 10 hits per sec and you probably *shouldn't* think about transitioning unless you need to

When You're Not Getting Many Hits

- So how many?
- A short answer is, *It Depends*
- A recent thread on London.pm had some basic numbers, those and experience give:
- About 40-50 hits per sec and you probably should think about transitioning
- About 10 hits per sec and you probably *shouldn't* think about transitioning unless you need to
- *Caveat: Take these numbers with much salt*

Even When You Are

- It may be cheaper to just buy more hardware and a LB
- Programmer time is still the largest cost for most projects

Even When You Are

- It may be cheaper to just buy more hardware and a LB
- Programmer time is still the largest cost for most projects
- You really do need Good Apache / perl people in-house

Even When You Are

- It may be cheaper to just buy more hardware and a LB
- Programmer time is still the largest cost for most projects
- You really do need Good Apache / perl people in-house
- It's surprising how often you can find yourself rooting around in the Apache source

When you have a substantial codebase

- Leak Hunting is a bitch

When you have a substantial codebase

- Leak Hunting is a bitch
- So is profiling

When you have a substantial codebase

- Leak Hunting is a bitch
- So is profiling
- CGI.pm's internals are a little ... peculiar

When you have a substantial codebase

- Leak Hunting is a bitch
- So is profiling
- CGI.pm's internals are a little ... peculiar
- Try to do one module at a time

When you have a substantial codebase

- Leak Hunting is a bitch
- So is profiling
- CGI.pm's internals are a little ... peculiar
- Try to do one module at a time
 - ◆ ...If possible

Thank You

Bonus Section: MVC issues

- It makes sense to subclass View (or its request object)

Bonus Section: MVC issues

- It makes sense to subclass View (or its request object)
- This can ease the pain of transition

Bonus Section: MVC issues

- It makes sense to subclass View (or its request object)
- This can ease the pain of transition
- Hides the difference between CGI and mod_perl requests
- Your View abstraction may be wrong

Bonus Section: MVC issues

- It makes sense to subclass View (or its request object)
- This can ease the pain of transition
- Hides the difference between CGI and mod_perl requests
- Your View abstraction may be wrong
- Easier when the same View class is used for all pages
- More work has to be done in the Control classes

Bonus Section: MVC issues

- It makes sense to subclass View (or its request object)
- This can ease the pain of transition
- Hides the difference between CGI and mod_perl requests
- Your View abstraction may be wrong
- Easier when the same View class is used for all pages
- More work has to be done in the Control classes
- If your Control classes care about their request type...

Bonus Section: MVC issues

- It makes sense to subclass View (or its request object)
- This can ease the pain of transition
- Hides the difference between CGI and mod_perl requests
- Your View abstraction may be wrong
- Easier when the same View class is used for all pages
- More work has to be done in the Control classes
- If your Control classes care about their request type...
- *...then your Control abstraction is probably wrong*
